

- T_1: {a, b, c, d, e, f, g}
- T_2: {d, f, g}
- T_3: {a, b, d, g}
- T_4: {a, d, g}
- T_5: {f, g}
- T_6: {e, f, g}
- T_7: {e, g}

102

Example for Dependency (50% as threshold)

{ag}

$P(a|g) = \text{count}(ag)/\text{count}(g) = 3/7$

$P(g|a) = \text{count}(ag)/\text{count}(a) = 3/3$

a->g, but not g->a

{ab}

$P(a|b) = 2/2$

$P(b|a) = 2/3$

a -> b, and b->a, (ab) is not frequent

108

204

Patterns Count

ab	3
ac	2
dc	2
...	

206

minsup = 3; minp = 0.6

{ab} is frequent, but not m-pattern

$$P(a|b) = \text{count}(ab)/\text{count}(b) = 1;$$

$$P(b|a) = 3/10$$

{dc} is m-pattern, but not frequent

$$P(d|c) = 2/3; P(c|d) = 1;$$

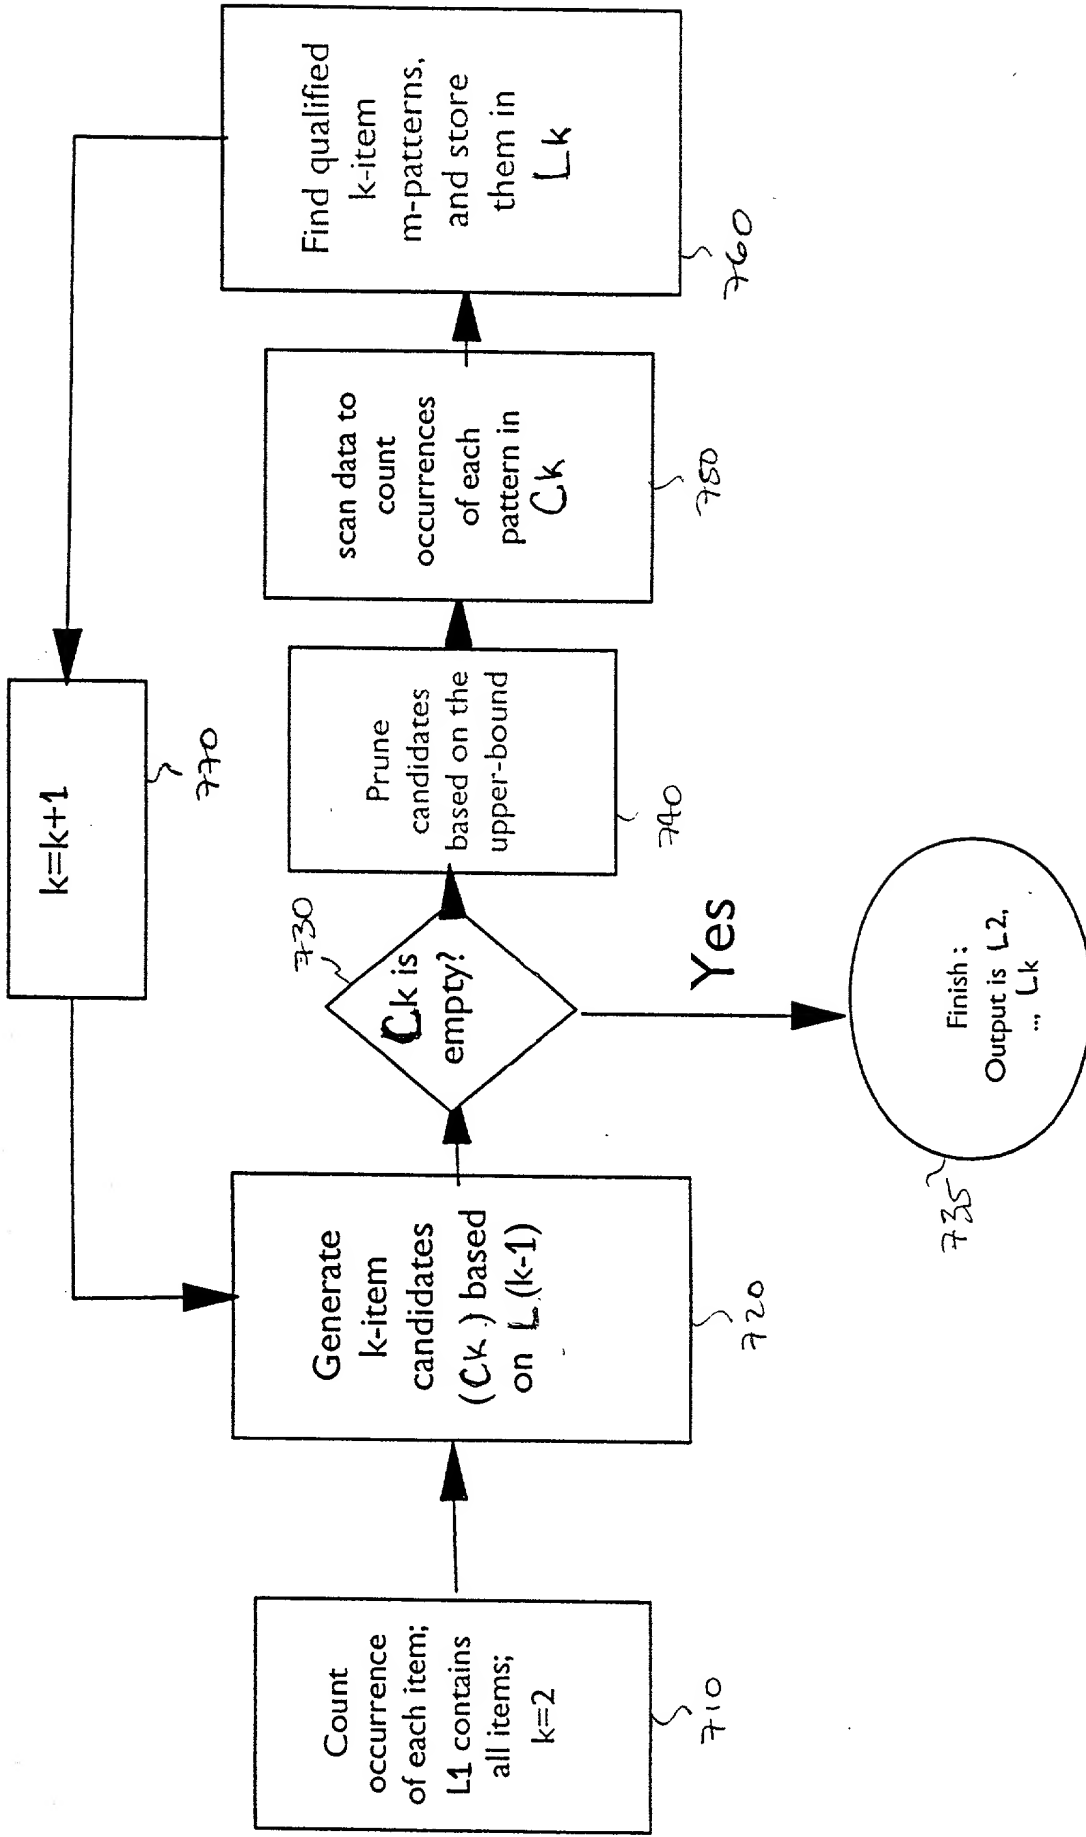

FIG 7

7/10
TS09690000262014

- Input: a set of candidates C_k , count information at all previous levels, and a threshold $\min p$
- Output: a set of pruned candidates C'_k
- Algorithm
 - For each pattern pat in C_k
 - For each item a in pat
 - ◆ Compute: $prob = Count(pat-a)/Count(a)$;
 - ◆ if $prob < \min p$
 - $C_k = C_k - pat$
 - break the for-loop
 - Return C_k

FIG. 8A

- Input: pattern pat , all count information, and a threshold $minp$
- Output: true if pat is a qualified m-pattern; otherwise false.
- Algorithm
 - For each a in pat
 - $prob = Count(pat)/Count(a)$
 - if $prob < minp$
 - ◆ return false
 - Return true
- This algorithm is $O(k)$
